UNIVERSITY *of* LIMERICK

OLLSCOIL LUIMNIGH

KEMMY BUSINESS SCHOOL

Department of Economics

End of Term Assessment

ACADEMIC YEAR:	**Autumn, 2009/10**
MODULE CODE:	**EC4307**
DURATION OF EXAMINATION:	**2.5 hours**
MODULE TITLE:	**ECONOMETRICS**
PERCENTAGE OF TOTAL MARKS:	**60%** (Remaining 40% awarded for two course work assignments)
LECTURER:	**Declan Dineen**
EXTERNAL EXAMINER:	**Dr Lisa De Propris**

INSTRUCTIONS TO CANDIDATES:

- Answer 3 (THREE) questions only out of the 6 (SIX) questions on this exam paper.
- Answer ***at least*** ONE question from SECTION A and ***at least*** ONE question from SECTION B.
- Put your answers to Section A and Section B in SEPARATE ANSWER BOOKS.
- PLEASE PRESENT YOUR ANSWERS IN A MANNER THAT IS CLEAR AND READABLE.
- All answers should be concise and relevant.
- All questions carry equal marks. Marks awarded for individual parts of each question are indicated on the paper.
- All rough work should be handed up with the exam paper.
- Non-programmable calculators are permitted.

STUDENT NAME: ______________________________

ID NUMBER: ______________________________

COURSE OF STUDY: ______________________________

SECTION A

A1. Consider the following model used to estimate how a hamburger chain's weekly revenue tr depends on price p, and advertising expenditure a

$$tr_t = \beta_1 + \beta_2 p_t + \beta_3 a_t + \varepsilon_t$$

where price p is measured in Euro while total revenue tr and advertising expenditure a are measured in Euro (000s).

The least squares output from estimating this equation appears in TABLE 1.0 below.

TABLE 1.0

Dependent variable:		*tr*		
Number of observations:		52		

Variable	Coefficient	Std. Error	t-statistic	p-value
Intercept	104.7855	6.482719	16.16382	0.0000
Price	−6.641930	3.191193	?	0.0427
Advert	2.984299	0.166936	17.87689	0.0000

R-squared	?
Adjusted R-squared	0.861660
$\sum (Y_t - \bar{Y})^2$	13581.35
Sum of squared residuals (RSS)	1805.168

(a) Interpret the estimates $\hat{\beta}_2$ and $\hat{\beta}_3$. Are the signs on these coefficients what you would expect from a theory or logical point of view? **(10%)**

(b) Calculate the estimated error variance $\hat{\sigma}^2_\varepsilon$ and standard error. **(10%)**

(c) Calculate the R^2. **(10%)**

(d) Calculate the t-statistic for $\hat{\beta}_2$ and using the test of significance approach, without using the reported p-value, test the null hypothesis that $\beta_2 = 0$ at the 5% level of significance. **(10%)**

(e) Interpret the p-value = 0.0427 given above, and say how this can be used to test for significance (i.e. to test the null hypothesis that $\beta_2 = 0$) at the 5% level. **(10%)**

(f) Calculate a 95% confidence interval for the true population parameter β_3. What does the interval tell you (i.e. in what are you 95% confident)? **(15%)**

(g) Test the joint hypothesis that $\beta_2 = 0$ and $\beta_3 = 0$ (that is, $\beta_2 = \beta_3 = 0$) using the F-test at the 5 per cent level of significance. **(15%)**

(h) Decompose the total sum of squares (*TSS*) of the dependent variable in a regression into its two components: the explained sum of squares (*ESS*) and the residual sum of squares (*RSS*). You may use a diagram to illustrate. **(20%)**

A2. **(a)** Explain the difference between a regression model which is linear in the *variables* and a model which is linear in the *parameters*.

With reference to the above, determine which of the following models satisfy the linearity assumption and, if nonlinear, say how the model can be *transformed* (to satisfy the classical linear regression model assumptions)

$Y = \beta_1 + \beta_2 X^2 + \beta_3 X^3 + \varepsilon$

$Y = \beta_1 X^{\beta_2} + e^{\varepsilon}$

$\log(Y) = \beta_1 + \beta_2 X + \varepsilon$ **(20%)**

Given the two-variable regression model

$$Y_i = \beta_1 + \beta_2 X_i + \varepsilon_i$$

(b) Apart from the linearity assumption referred to above, briefly, describe the other classical linear regression model assumptions underlying the OLS estimation technique. Use well-labelled diagrams to support your answer where appropriate. **(20%)**

(c) Derive the least-squares normal equations for β_1 and β_2 and proceed to derive the estimator for β_2. **(35%)**

(d) Describe the Gauss-Markov theorem and prove that the estimator for β_2 is linear and unbiased. **(25%)**

A3. Suppose we posit the following demand for money relation

$$M0_t = \beta_1 + \beta_2 GNP_t + \beta_3 i_t + \varepsilon_t$$

where $M0_t$ = demand for money (*nominal* cash balances)
i_t = an interest rate indicator (%)
GNP_t = Gross National Product

Based on quarterly data for 1972Q1-1989Q4, the following results in TABLE 2.0 were obtained:

TABLE 2.0

Ordinary Least Squares Estimation

Dependent variable is M0
72 observations used for estimation from 1972Q1 to 1989Q4

Regressor	Coefficient	Standard Error	T-Ratio[Prob]
INPT	-27.9858	6.8392	-4.0920[.000]

DW-statistic	.14432		

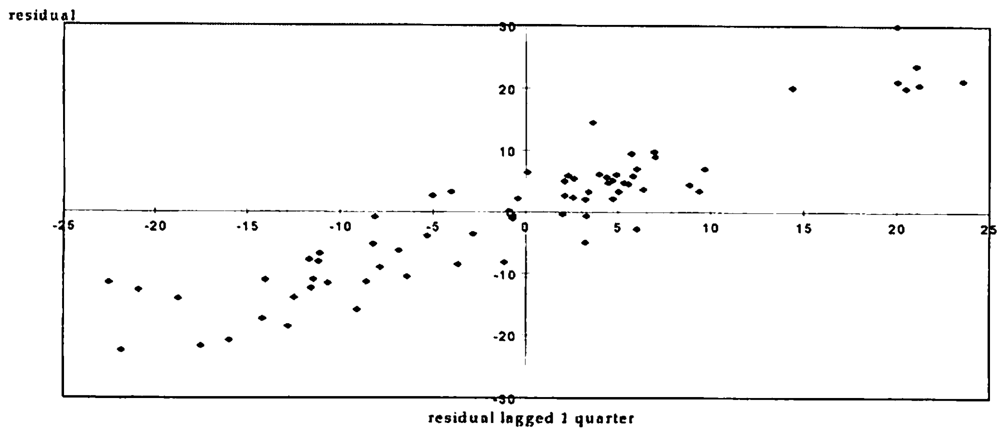
Diagnostic Tests

Test Statistics	F Version
A: Serial Correlation	F(4, 65) = 111.9423[.000]
B: Functional Form	F(1, 68) = 53.1390[.000]
C: Heteroscedasticity	F(1, 70) = 65.4813[.000]

A: Lagrange multiplier test of residual serial correlation
B: Ramsey's RESET test using the square of the fitted values
C: Based on the regression of squared residuals on squared fitted values

Plotting the estimated residuals from this regression on their values lagged one time period gives FIGURE 1.0:

FIGURE 1.0



(a) What is autocorrelation?

How would you distinguish between *"pure"* autocorrelation and apparent autocorrelation resulting from specification error?

Discuss the consequences of *"pure"* autocorrelation for estimation and hypothesis testing using OLS estimates. **(30%)**

(b) Derive the Durbin-Watson test statistic and describe how it is used to test for autocorrelation.

What are the weaknesses of this test? **(25%)**

(c) What does FIGURE 1.0 show? Based on the results given in TABLE 2.0, conduct a formal test for autocorrelation in this model. Does the outcome of this test support the evidence from FIGURE 1.0? **(20%)**

(d) In the presence of *"pure"* autocorrelation, describe the Cochrane-Orcutt method for estimating the autocorrelation coefficient ρ. **(25%)**

SECTION B

B1. **(a)** What is heteroscedasticity? Illustrate with the aid of a diagram(s)

Discuss the consequences of heteroscedasticity for estimation and hypothesis testing using OLS estimates. **(30%)**

(b) Given the demand for money regression model

$$M0_t = \beta_1 + \beta_2 GNP_t + \beta_3 i_t + \varepsilon_t$$

where $M0_t$ = demand for money (*nominal* cash balances)
i_t = an interest rate indicator (%)
GNP_t = Gross National Product

Two scatter plots of the estimated squared residuals on

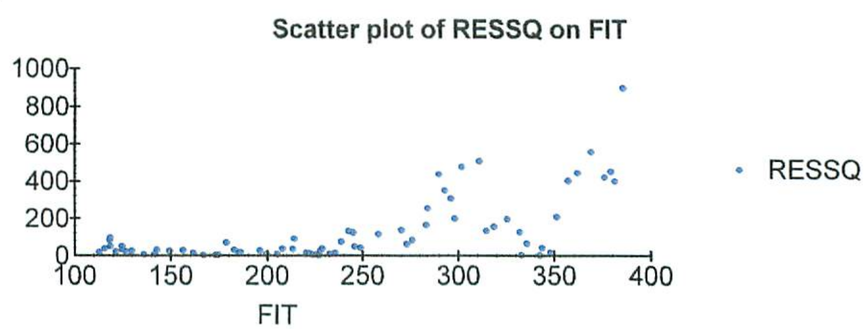
(i). the fitted values from the regression line and
(ii). the *GNP* explanatory variable

are shown in FIGURE 2.0 below.

Explain what the researcher hoped to achieve with the scatter plots in FIGURE 2.0? What does FIGURE 2.0 show? **(15%)**

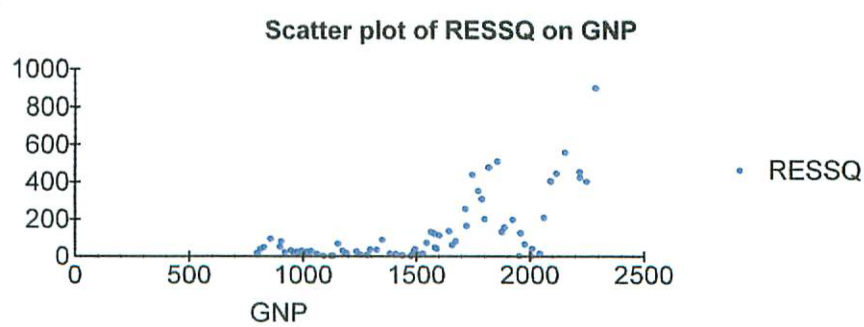
FIGURE 2.0

(i).



where
RESSQ denotes the residual squared $\hat{\varepsilon}_t^2$ and
FIT denotes the fitted values from the regression line.

(ii).



where
RESSQ denotes the residual squared $\hat{\varepsilon}_t^2$ and
GNP denotes the values for the explanatory GNP variable.

(c) Describe the *White's test* method which can be used to detect the presence of heteroscedasticity.

Based on the results given below, what do you find in relation to the presence of heteroscedasticity? Does the outcome of the *White's test* here support the evidence from FIGURE 2.0? **(25%)**

Diagnostic Tests

Test Statistics	F Version
A: Serial Correlation	$F(4, 65) = 111.9423[.000]$
B: Functional Form	$F(1, 68) = 53.1390[.000]$
C: Heteroscedasticity	$F(1, 70) = 65.4813[.000]$

A: Lagrange multiplier test of residual serial correlation
B: Ramsey's RESET test using the square of the fitted values
C: Based on the regression of squared residuals on squared fitted values

(d) Describe the GLS/ WLS method of correcting for heteroscedasticity when σ_i^2 is known.

Consider the two-variable regression model

$$Y_i = \beta_1 + \beta_2 X_i + \varepsilon_i$$

Explain how the weighted or generalised least squares estimator works when:

$\sigma_i^2 = \sigma^2 X_i^2$

$\sigma_i^2 = \sigma^2 X_i$ **(30%)**

B2. Explain/ discuss the following:

(a) In intuitive terms, what is the difference between stationary and nonstationary time series processes?

What is a "stationary stochastic process"? **(20%)**

(b) The autocorrelation function (ACF). The general characteristics of the correlogram for stationary and nonstationary processes. **(15%)**

(c) The Dickey-Fuller (DF) and Augmented DF tests. **(25%)**

(d) The meaning of a series being "integrated of order 1," that is I(1). The concept of cointegration and ONE test of whether two time series are cointegrated. **(25%)**

(e) A regression between two nonstationary variables can produce spurious results. If the variables are nonstationary, and not cointegrated, is there any relationship that can be estimated (mention any problems with your approach here)? **(15%)**

B3. **(a)** What is meant by multicollinearity?

Suppose you want to fit the model

$$Y_i = \beta_1 + \beta_2 X_{2i} + \beta_3 X_{3i} + \varepsilon_i$$

using a sample for which $X_{3i} = a + b X_{2i}$
for all i,

can you estimate the three unknowns $\hat{\beta}_1$, $\hat{\beta}_2$ and $\hat{\beta}_3$? Why or why not?

(15%)

(b) Discuss the consequences of multicollinearity for OLS estimation. **(20%)**

(c) Describe the auxiliary regression method which can be used to detect for the presence of multicollinearity. **(20%)**

(d) *"A high degree of multicollinearity may have an adverse effect on regression results, but this is by no means inevitable."*

Discuss this statement. **(20%)**

(e) When faced with severe multicollinearity, one remedial measure might be to drop one of the collinear variables, describe how you would test whether the exclusion of a variable significantly decreases the explanatory power of a regression model.

Are there any problems which might be encountered in dropping a variable from the model? **(25%)**
